The expectations for the IBM hands-on workshop were to watch the webinar and then apply what we learned through the webinar and create a program of our own using IBM Bob. I decided to create a file organizing system with Bob. Decisions I made from a technical perspective were how to make the system and how to actually make it work. I opted to just sort images into a file of the same extension. I was originally going to make it sort an entire directory with multiple folders but decided for time constraints and to keep it simple to just make it sort files in one folder. I did not work with a team during this event and was by myself. My contributions to the program were the initial framework including methods, imports, and system calls, and Bob to help me make the functionality of the program. I would give myself a good quality assessment. I watched the webinar lesson that was before the workshop and then applied what I had learned there to help me go about making my program. I used Bob in the same way that was shown in the webinar to get a feel of how it would feel to use Bob in an industry setting and make a good product because of it. If I could re do the event, I think that I would try to make a more complicated program that did more than just sort files in a directory.
